

yuji nelson

Senior Software Engineer, Front-end Reading, UK

yujinelson.com k.yuji.nelson@gmail.com github.com/justaddcl linkedin.com/in/yujinelson

SUMMARY

Senior Software Engineer (12+ years) specialising in the React/TypeScript ecosystem and the front-end/API boundary. Recently led architecture for Cleo's Earned Wage Access Request Tab rebuild, replacing complex client-side branching with predictable, backend-driven states, and delivered A/B-tested fintech workflows reaching over a million users. Recognised for engineering craftsmanship and building maintainable product experiences across fintech, travel, e-commerce, and enterprise software.

SKILLS

Front-end

TypeScript, React, React Native, Next.js, TanStack Query, Redux Saga, Tailwind CSS, Storybook, HTML, CSS,

APIs & Backend

TypeSpec / OpenAPI, tRPC, GraphQL, Node.js, Drizzle, PostgreSQL

Product & Delivery

A/B testing, feature flags, data exploration, product dashboards, session replay, customer-support investigation, production monitoring

AI-assisted Engineering

Codex, Claude Code, Cursor, Conductor; manual review before shipping

EXPERIENCE

Senior Software Engineer, Front-end · Cleo

Jun 2024 - June 2026

- Ensured 100% UI parity across US/UK markets by leading the React Native rebuild of the Earned Wage Access flow; simplified deeply nested, 10-outcome hooks into a backend-driven state architecture, reducing component complexity to 1-3 predictable outcomes.
- Feature-led Earned Wage Access disbursement flow improvements across a 2M+ user A/B test population, recovering delayed delivery, catching a launch-blocking card-linking regression before release, and investigating support-contact issues using Count dashboards and Intercom transcripts.
- Authored the front-end chapter's Redux Saga to TanStack Query migration playbook, later adopted by Front-End Platform as the guide for a wider migration away from legacy data-fetching patterns.
- Led a same-day production hotfix for an Earned Wage Access reload incident, diagnosing the issue as an API contract/type-boundary problem, shipping a minimal fix, then following up with a Rails/TypeSpec enum change that caught a missing UK payment-rail value within 24 hours.
- Submitted 580+ code reviews across the engineering organisation, becoming a trusted reviewer for complex React Native, TypeScript, Redux Saga, and API-boundary changes.

Senior Software Engineer · Teya

Nov 2022 - Jun 2024

- Acted as Customer Service Portal (CSP) workstream lead for most of 2023, driving sprint planning, technical direction, and cross-workstream sequencing for Teya's merchant back-office platform.
- Led the architectural decision to adopt react-hook-form across CSP, comparing Formik, React Hook Form, and React Final Form with proof-of-concept PRs before shipping the foundational form refactor.
- Reduced post-release regressions and improved PR turnaround time by serving as 'Code Quality Ambassador'; introduced ESLint standards and mentored junior engineers, elevating the bar for technical review across CSP.
- Eliminated feature dependencies on the Java backend team by taking ownership of GraphQL BFF changes (TypeScript/Node); implemented VAT calculations, bank mutations, and billing migrations, enabling the frontend team to ship merchant platform features independently.

Software Engineer, Front-End · Duffel

Nov 2021 - Sep 2022

- Enabled instant order discovery for customers by partnering with backend engineering to tune and integrate a site-wide search service using Meilisearch; led the full frontend implementation and UX design integration for the Duffel Next.js platform.
- Developed new loyalty programmes feature for multi-step search and checkout process with Formik and TypeScript.
- Implemented a feed-style homepage for the Duffel Next.js web application to educate users about the product as well as highlight new product features.

Front-End Web Developer · Magpul Industries

Sep 2017 - May 2021

- Drove 3x year-over-year growth in e-commerce sales for a site with 500k+ monthly visitors by leading a mobile-first UI/UX overhaul and developing high-conversion landing pages (4x unique view increase).
- Automated manual workflows by 90%+ by building custom Node.js CLI tools and browser extensions that enforced frontend consistency and streamlined internal e-commerce management tasks using GraphQL and REST APIs.

Web Developer · Boeing

Jul 2014 - Jun 2017

- Consolidated 20+ disparate websites into a unified enterprise web strategy, partnering with product teams to eliminate UI inconsistency and significantly reduce manual maintenance workload.
- Reduced support tickets by 50% by architecting and developing the UX/UI for the enterprise self-service documentation platform, enabling 1,200+ employees to efficiently find hardware standards and technical instructions.

SELECTED PROJECT

Sanbi · Side project

In progress

- Developing a full-stack worship planning app for church leaders to manage song libraries, build setlists, track song usage, and prepare events. Built with Next.js App Router, tRPC, Drizzle, PostgreSQL, and Tailwind CSS, with 3 rounds of mid-fidelity user testing completed and 100+ PRs merged while working toward v0 launch.

EDUCATION

University of Washington

09/2011 - 06/2014 // Seattle, WA

Bachelor of Arts in Information Systems & Business Administration
